BOUNDLESS ENERGY™

Fuel-Free Power Plan

On November 17, 2022 PSO asked the Oklahoma Corporation Commission for approval of its Fuel-Free Power Plan to purchase three new wind farms and three new solar facilities located in Kansas and Texas. The proposed plan will help meet future power needs, generate 995.5 megawatts (MW), and protect customers from volatile energy costs driven by high natural gas prices.

BENEFITS INCLUDE:

- ▶ **Continued reliability**—PSO ownership puts reliability at the forefront by adopting design standards (including cold weather turbine packages) that keep the facilities online throughout the year and especially during times of grid stress.
- ▶ **Stable prices and long-term affordability**—These facilities insulate PSO customers against sudden spikes in natural gas prices.
- ▶ **Economic growth**—More than half of prospective businesses considering expanding or locating in PSO's service area require access to renewable energy. These facilities make our service area more competitive for attracting jobs and investment.
- ▶ **PSO customers already benefit from the fuel savings of wind energy**—The wind farms of the North Central Energy Facilities are estimated to save customers at least \$156 million in fuel costs from October 2022 to December 2023.
